CAROL VALLÈS

Arrels fortes, mans inquietes

Sulfits: < 4 mg/L

Acidity (tartaric): 6.8 g/L

Residual sugar: < 0,5 g/L

quatre peus

Vintage: 2021

Variety: Macabeu fermented in french oak barrel

Agriculture: Organic

Vol: 11%

Number bottles: 520

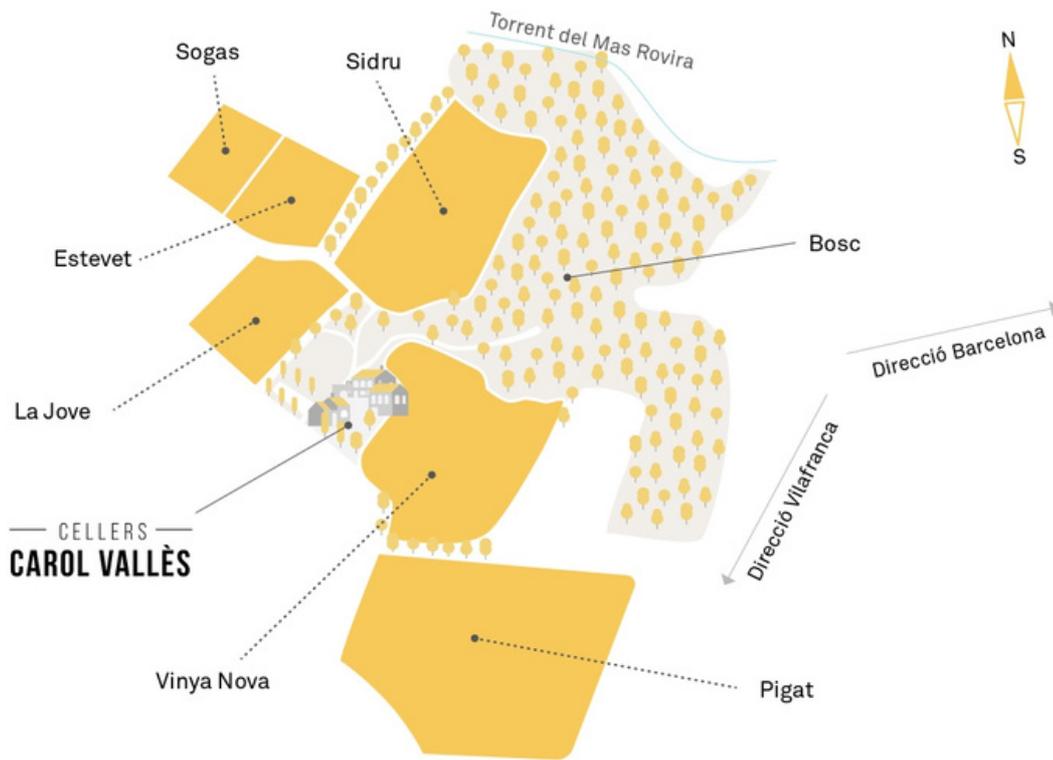

Wine making

• An idea. Eight Hands. Four people. Those facts and the quality of the grapes born in our “Estevet” vineyards, older than 40 years, have been the strength that allowed us to create this wine.

• The 9th of September 2021, at 7:00am in the morning, we harvested by hand and in boxes of 20kg, 662 kilos of Macabeu grapes planted on a soil of calcium and clay. We began to press in a vertical press and we finished this pressin with our feet, two people for 13 hours in a row. The 11th of September we racked the wine and we filled a used French oak barrel of 300 liters. The 14th of September began to spontaneously ferment without any added yeast, only with its own wild yeast. The 5th of October the fermentation ended. During this fermentation in the oak barrel, we got toasty notes and aromas of vanilla. With minimal oxidation, the color keeps being pale and clean. This wine stayed in the barrel until February next year to get all the aromas of evolution in wood, however we did not allow those aromas to become the main feature of the wine.

• This wine doesn't have any added sulfur, hasn't been clarified nor filtered. This is a wine that wants to respect the grapes and we worked with minimal intervention possible to do it so. The result is fruit from our old vineyards.

• It might have precipitates as it hasn't been filtered.

Organic agriculture - Estevet vineyard

All our Macabeu vineyards are CCPAE eco certified since 2014. The grapes used to elaborate this wine come from Estevet vineyard, planted in 1974. This is a vineyard situated in Subirats, by a small river in a soil made of clay and calcium. Its performance is small, but its fruit is of high quality. Ecological agriculture is based on the observation of our soil to coexist in harmony and to work it in the most sustainable way possible. We do not treat our trees with chemical insecticides or herbicides, we allow lower vegetation to spontaneously cover the soil so we can better preserve soil humidity and we get natural green fertilizer after we plow.
